# What Works? Research into Practice

A research-into-practice series produced by a partnership between The Literacy and Numeracy Secretariat and the Ontario Association of Deans of Education

How can teachers improve the academic performance of children with ADHD?

## Research Tells Us

Beyond difficult-to-manage behaviour, ADHD also includes impairment in regions of the brain related to processes that are key for learning.

*Executive function* allows us to develop and carry out plans, organize ourselves and activities, inhibit actions, regulate emotions, and self-monitor. It also directs academic performance and behaviour.

*Working memory* refers to our “mental workspace”. It enables us to momentarily hold and manipulate information in the face of ongoing processing and/or distraction. It is a strong predictor of literacy.

**DR. ROSEMARY TANNOCK** holds a Canada Research Chair in Special Education and Adaptive Technology (Tier 1) at OISE. She is also a senior scientist at the Hospital for Sick Children in Toronto and a professor of psychiatry and of special education at the University of Toronto. Dr. Tannock and colleagues Dr. Rhonda Martinussen (OISE), Dr. Alison McInnes (University of Windsor), and Peter Chaban (Hospital for Sick Children) are conducting a study of a professional development program for teaching children with ADHD for the Bluewater District School Board. They are also working with the Ontario Provincial Demonstration Schools to develop a systematic curriculum for Teacher Professional Development, which will be taught by core Provincial School faculty in a three-day summer institute this year.

## Research Monograph # 3

# The Educational Implications of Attention Deficit Hyperactivity Disorder

By Dr. Rosemary Tannock  
OISE/University of Toronto

Teachers should be aware that although there are many different perspectives on ADHD, there is ample scientific evidence affirming its existence and its detrimental impact on individuals. Classroom practices can make a difference for children with ADHD.

Attention Deficit Hyperactivity Disorder (ADHD) is the medical term used to describe a neurobiological condition that affects between 5 and 12 per cent of children worldwide with impairing levels of inattentive or hyperactive/impulsive behaviour, as well as those with a formal diagnosis of ADHD. A diagnosis is based on developmentally inappropriate behavioural symptoms that begin in pre-school years and tend to persist through childhood, adolescence, and adulthood.<sup>3</sup> These symptoms include inattention, hyperactivity, and/or impulsivity.

Medical, educational, and legal organizations view ADHD as a behavioural disorder but they also recognize that many children with ADHD (as many as one in four) also have Learning Disabilities (LDs).<sup>3,4</sup> Many children with ADHD – not just those with a Learning Disability (LD) – are at high risk for academic underachievement or failure despite having average or above average intellectual abilities.<sup>1,5-6</sup>

Longitudinal epidemiological surveys in Canada and the United States show that childhood ADHD (and particularly childhood inattention) predict subsequent lower achievement scores in reading and mathematics (8 to 10 per cent lower). These surveys also indicate an increased risk for grade repetition and high school incompleteness as well as underemployment and poor workplace performance in adulthood.<sup>1,5-10</sup>

ADHD is associated with subtle but important structural and functional differences in the brain, specifically those regions that support critical psychological processes. These processes include executive function, memory, learning, and speed of information processing.<sup>11-13</sup> Cognitive research shows that individuals with ADHD process information more slowly than their peers and have difficulty with executive functions, particularly working memory.<sup>14-21</sup>

## Implications for Educational Practice

### Support and Improve Executive Function

Classroom teachers should try to reduce the amount of information students with ADHD have to retain and juggle in their heads:

- Emphasize direct instruction in specific academic skills
- Chunk, pause, and repeat critical instructions
- Use advance organizers, structured note-taking sheets, manipulatives, and visual representations
- Use teaching/learning strategies such as mnemonics
- Introduce class-wide peer tutoring

Research into treatment outcomes shows that medical and psychological interventions are generally effective in reducing disruptive and off-task behaviour in students with ADHD.<sup>24</sup> These include:

- medication,
- parental training in behaviour management,
- classroom-based behaviour training,
- social skills training and multimodal approaches.

According to laboratory tests, medication may improve processing speed and some aspects of executive function in children with ADHD.<sup>25</sup> Unfortunately, no robust evidence exists to date that suggests these approaches (alone or in combination) benefit educational outcomes.<sup>24, 26-27</sup> However, school-based interventions, where teachers have modified their instructional practices and used behavioural management techniques, have been found to improve both behavioural and literacy outcomes in students with ADHD.<sup>24, 28-29</sup> As well, intense and systematic computer-based training with working memory has shown promise for both cognitive and behavioural improvement in children with ADHD.<sup>30</sup>

### We need to reconceptualize ADHD

Beyond difficult-to-manage behaviour, ADHD also includes impairment in “one or more processes related to perceiving, thinking, remembering, or learning.”<sup>34</sup> Therefore, it may be more useful to view ADHD as a learning disorder, though one that differs from currently recognized reading or non-verbal LDs.

Under current Canadian educational policies and employment laws, recognizing ADHD as a type of LD would confer the right to accommodations in schools, colleges, and workplaces. While this would significantly increase the cost of assessment and education, the current socio-economic costs of ADHD are exceedingly high.<sup>31-33</sup> It would be a case of short-term financial pain for long-term national gain in human and social capital.<sup>1, 34</sup>

### We need to change teaching practices

Students with ADHD benefit from an inclusive educational model where teachers use the latest teaching strategies for students with a LD. Indeed, these same instructional practices could be considered best practices for all students in mainstream classrooms.<sup>35</sup>

Currently, classroom interventions for students with ADHD focus on reducing problematic behaviour and increasing task engagement. While these are important goals, reducing disruptive behaviour alone does not ensure learning and academic progress. To achieve this, academic interventions are required that will address academic deficits directly, while accommodating and improving cognitive difficulties in executive function and processing speed. There are two critical principles behind academic intervention:

- Reduce the cognitive load of academic tasks and avoid overloading working memory and
- Support and improve executive function through modified instruction.

All teacher-preparation programs should ensure that the latest ADHD scientific evidence and the most recent advances in educational intervention are core components of their curricula.<sup>35</sup>

## Special Education in Ontario

In May 2005, the Ministry of Education allocated \$25 million to the Council of Ontario Directors of Education (CODE) to develop a plan to support the recommendations in the ministry's special education expert panel report *Education for All*. The report's recommendations focus on strategies to improve teacher professional practice and to raise the achievement of students with special education needs.

The CODE Project involved 75 supervisory officers, 21,000 school board employees, and almost two million students. Evidence-based strategies such as differentiated instruction, assistive technology, and professional learning communities were introduced and monitored for their impact on student achievement. Overall, evaluations show that the outcomes have been positive. The work is ongoing as board practice shifts to include students with special needs in regular classrooms and to zero-in on effective teaching strategies for *all* students.

Twelve categories of exceptionality have been developed in Ontario to assist in the identification and placement of exceptional students. Although ADHD is not named as a specific category of exceptionality, students with ADHD may present characteristics that can be identified in the various categories such as Learning Disability or Behaviour.

## Professional Learning

The Literacy and Numeracy Secretariat creates training, resources, and institutes to support ongoing professional learning:

- **Coaching, Facilitating, and Co-Teaching: Professional Learning for Numeracy and Literacy Leaders**  
<http://www.curriculum.org/LNS/coaching/>
- **Differentiated Instruction Webcast featuring Jeffrey Wilhelm, Lyn Sharratt, Elizabeth Coelho, and Camille Williams-Taylor**  
This webcast discusses strategies proven to be successful with struggling students. Includes demonstration of a think-aloud as a high-yield strategy, the power of accountable talk, and how to connect assessment to instruction.
